

DANIEL FAGBOHUNLU

Systems & Backend Engineer.

Architecting scalable microservices, concurrent databases, and hardware-integrated telemetry workflows.

COLLABORATIVE ENGINEERING

I build systems with the understanding that software is a team sport. Utilizing Agile methodologies to drive transparency, iteration, and robust cross-functional deployment.

TEAM SYNERGY 01

01

AGILE STANDUPS

Consistent participation in daily standups to unblock dependencies, track progress, and align backend deliverables with immediate business objectives.

02

CONFLICT RESOLUTION

Diligent Git flow management. I systematically isolate and resolve complex merge conflicts when collaborating on core API routes with fellow engineers.

03

LLM PAIRING

Integrating AI as a collaborative pair-programmer to scaffold tests, validate Zod schemas, and accelerate the documentation pipeline for the entire team.

OGALANDLORD BACKEND

Transitioning architecture from disparate profiles to a
single consolidated database model for a thriving
professional property tech ecosystem.

SCHEMA CONSOLIDATION 02

+ **PROBLEM** Fragmented database profiles for Tenants and Agents resulted in data integrity risks, complex merge conflicts, and highly redundant authentication logic.

+ **APPROACH** I broke down the schema changes using Prisma, isolated conflicts in Git alongside the team, and engineered a unified JWT flow utilizing Google OAuth 2.0.

+ **RESULT** Successfully merged the Tenant and Agent profiles into a centralized User model without losing data, delivering over 25 error-safe RESTful API endpoints.

A minimalist modern architecture building abstract, featuring a clean, geometric design with a light gray background and a dark gray outline.

LYTUP EMS API

Architecting an Energy Management System API to
process real-time edge telemetry and orchestrate
concurrent access safely.

THREAD-SAFE AUTH 03

+ **PROBLEM** Handling Keycloak authentication tokens concurrently for the Lytup API risked severe race conditions and memory overhead during peak user requests.

+ **APPROACH** Engineered a custom AuthStore in Go utilizing Mutexes (sync.Map) and integrated gjson to bypass static reflection overhead on complex payloads.

+ **RESULT** Deployed an entirely thread-safe, high-performance authentication layer covering 100% of user logins, eliminating runtime deadlocks and optimizing memory.

HARDWARE TELEMETRY 04

- + **PROBLEM** The Energy Management System required a highly reliable, real-time data pipeline from isolated inverter stations and edge devices (like Raspberry Pi).
- + **APPROACH** Engineered stable serial communication utilizing Modbus over RS485 protocols to consistently query edge devices and transmit hardware telemetry.
- + **RESULT** Created a continuous, fault-tolerant data pipeline feeding live power station metrics directly into the cloud EMS for real-time monitoring.

TECHNICAL STACK 05

GO / EDGE SYSTEMS

- **Concurrency:** Race condition mitigation using Mutexes & thread-safe pipelines.
- **Hardware Comms:** Edge device telemetry via Modbus and RS485 protocols.
- **Data Optimization:** High-performance JSON processing bypassing reflection.

NODE.JS & TYPESCRIPT

- **API Design:** Strict validation layers utilizing Express.js 5, TypeScript, and Zod.
- **Database Architecture:** Relational schema management on PostgreSQL using Prisma.
- **Test-Driven:** High coverage authentication testing with Jest and Supertest.

LLM-ACCELERATED **WORKFLOW** 06

Generating boilerplate Zod data-contracts instantaneously mapping directly from Prisma relational database models.

Translating deep, cryptic database compilation errors to isolate issues and deploy architecture fixes rapidly.

Utilizing LLMs to generate robust Express route structures, then hand-refining for advanced edge cases.

Standardizing extensive markdown files and generating high-accuracy regular expressions for custom sanitizers.

KEY MILESTONES 07

MODBUS COMMS

Established robust serial communication with remote inverters for telemetry.

AGILE DELIVERY

Authored unified API specs and resolved complex Git merges via daily standups.

SCHEMA MERGING

Successfully consolidated database profiles alongside the team without data loss.

THREAD-SAFETY

Implemented Mutexes to completely eliminate Keycloak API race conditions.

INITIATE CONTACT

Looking for systems and backend software engineering opportunities. Always ready to build with a team.
